

# YOY Temp Diff Heat Map

## Overview

This is another insight panel that is simple in execution but can come in quite handy. The purpose of this panel is to have a quick visual at your fingertips to tell you if the temperature in a given state is higher or lower than it was on this day the year prior. Hovering over any state will bring up a box that lets you know the number of degrees the temperature is higher or lower. This can compliment any number of insight panels, and we recommend it as a great addition to any view you have built using other insight panels.
